Annotation

In this diploma work, the stock market is investigated, on the basis of which a trade advisor is created using the C # programming language.

The analysis of the securities market was conducted, on the basis of which it was revealed which trading robots and trade advisers are, and also what kind of trade adviser we need. To implement the trading advisor, the C # programming language and the Microsoft Visual Studio development environment were used.

In the last two chapters, economic calculations for the software product were considered, as well as life safety issues.
