

Annotation

In this graduation project, a web-application for generating business-plans was developed, written in Java with a connection to the Postgresql database.

The aim of this software product is to help start-up entrepreneurs to make initial calculations of economic indicators, to understand the necessary sections of the business plan and analyze the situation on the sales market.

In addition, in the last two chapters of the projects, calculations were made of the cost of the software product and life safety issues were considered
