

Annotation

The diploma project describes the design and creation of a software product for tracking the progress of students of the REIS AUPET department in a PHP programming language with the ability to monitor through a mobile application. The introduction of the product will automate data on the academic performance of the students of the department, and will also allow users to have access to their information remotely. While implementing the portal, the framework Laravel was used to improve security. An information system of this kind provides an opportunity to rationally use resources, provides transparency of monitoring, both for students and for their parents. The application interface was created in Android Studio.
