Annotation

Hide administration allows to manage the information system remotely, without requiring some effort and cost. In this graduation project, software development with an ergonomic interface and convenient control is considered, with the aim of implementing hidden administrative functions and containing three programs, namely a screen spy, keylogger and spy process.

In the economic part, the possible economic costs are calculated to develop software and the economic component is calculated for the development of the application.

In the section of life safety, optimal working conditions are determined, calculation of natural and artificial lighting is carried out.
