Annotation

The purpose of this project is to create an automated information processing system using personal computer software and simplify the creation of reports that greatly facilitate the work of any institution. Just like the world's population every year, the pace of modern life is growing. In this regard, the volume of work with information for employees of various government agencies is increasing. Therefore, it is proposed to create a system that allows employees of the institution to facilitate the work. The presence of a database in the city hospital can solve many problems.

Currently, many medical institutions are connected through a computer network. Reforms in the field of health care are aimed at the centralization of medical institutions and the creation of a single large administrative and economic management.

In this regard, the administration of these hospitals and polyclinics of other hospitals and clinics causes a serious problem: combining data and creating a common database of patients.

In the process of achieving the goal are the following tasks:
– analysis of application requirements;
– developed software structure;
– selection and design of the platform on which the program is developed;
– testing of the developed application.
