Annotation

The modern education system makes maximum use of information technology and computer telecommunications. In our work we decided to focus on the modern topic of automation and consider a specific example of creating an automated system for the library. The relevance of the thesis-discussion of the automation of the educational process of educational institutions.

The aim of the diploma project is to create an automated information system that will help employees responsible for working with the library, to minimize the cost of performing frequently performed operations and work with readers and process information relating to the activities of the library. The automated information system of the library is designed to enter, store and process information about printed publications included in the library, readers visiting the library. Information about readers should contain personal data and data in printed publications to be subscribed. Information about the book should contain the theme, Author, publisher, year of publication, number of copies and stored in the order of the educational field (subject directory).
