

## **ANNOTATION**

The Capstone project is designed to protect databases from SQL injection attacks. The project provides the concept of a database, its structure, and discusses the main features of SQL Server Management Studio (SSMS). In a database, analyzing the threats that threaten databases, including SQL-injection, is covered by the threat protection. To protect the database from SQL injections, efforts are made towards database administration, as well as checking the reliability of its protection through the database testing process.
