

Annotation

In the thesis project is developed an automated information system permitted drugs, intended for use by patients. The peculiarity is that when it was created, information was taken into account from the Kazakhstan national formulary and the national center of expertise, that is, in the search, there is information on all medicines existing on the international market, but also the medical means registered in Kazakhstan are allocated separately. Development is implemented in HTML and JavaScript. The introduction of this system will make the average person more literate in choosing medicines and more responsible for his health. It will also allow to correct the process of prescribing drugs by the doctor, taking into account the individual intolerance of individual drugs by the patient, as now patients themselves have access to this information.
