

ANNOTATION

Fires cause enormous material damage and in some cases result in loss of life. Therefore, fire protection is the most important responsibility of each member of society and is carried out on a national scale.

Fire protection aims to find the most effective, cost-effective and technically sound ways and means of preventing fires and their elimination with minimal damage with the most rational use of forces and technical means of extinguishing.

Fire safety is a condition of object at which possibility of the fire is excluded and in case of its emergence necessary measures for elimination of negative influence of dangerous factors of the fire on people , constructions and material values are used
