

Annotation

The TDMA standard allows each consumer to fully resolve the frequency range in the shortest period of time (in the GSM system, one frequency range is divided into 8 time slots). Currently, TDMA technology dominates the cellular network. GSM, TDMA (ANSI-136), and PDC systems are used in satellite communications. In this regard, the TDMA method provides for the calculation of the main parameters of the organization of cellular communication at the Almaty 1 station. In addition, life safety and economic financing are calculated.
