Theme of the graduation project: "Development of software for automation of purchase processes support and for accounting the storage of goods in the warehouse" for LLC "Kniga-NV".

This graduation project has implemented the development of a system for recording the movement of goods in a small enterprise's warehouse, the purpose of which is to implement an automated complex to support such processes as the purchase and accounting of storage of goods.

The graduation project was executed in the format of an application based on PHP. To achieve the goal of the developed graduation project, technologies such as the MySQL database and server data integration were applied.

An economic calculation of the costs and costs of developing the program, an assessment of the economic feasibility of the developed project was also carried out.
