The objects of automation during the design process are the process of promptly obtaining information about the timetable of students and teachers, the process of instant exchange and obtaining information between users of the system. In addition, the «AUES Mobile» mobile application has functions that allow students to track information about their debts, information about payments and scholarships. Before users opens all the information about the university. The interface is presented according to the rules of Material Design. During the design, password hashing methods were used, as well as a token system for secure data protection and not receiving information by second persons. The mobile application is search and reference type software, as well as an information input and processing system. This information system serves to timely provide appropriate information to the right users in the person of teachers and students. As a result of graduation design, the mobile application «AUES Mobile» was created for smartphones based on the Android operating system for the «AUPET» named after Gumarbek Daukeev.
