Annotation

The main goal of this graduate project is to creation an information system for the analysis of an enterprise statistics using modern computer technologies. Analysis and data processing is carried out by using technology and computers to improve the analysis of economic activity. The efficiency of the enterprise depends on the level of creation and processing of its information system. Statistical information system rely on a single information baseline, which is a source of information to perform all management functions at the enterprise, and are characterized by high efficiency, equivalence of calculations, the use of mathematical and statistical methods to specific results based on the analysis of the received primary information, forecast orientation and integration.
