

## **Annotation**

In this thesis, we will learn how to perform web application intelligence, find out how many ports were used for what and by whom they were tapped. How much our website is resistant to brute-force ftp access passwords. And also how to use man-in-the-middle to identify the internal structure of the website, which opens up a potential vulnerability to external influence. The main idea of this work was to identify vulnerabilities and violations of the work and then describe the methodology.
